

Industrial/Manufacturing Properties

Heavy Industrial

Here is where the magic happens! Raw materials are converted into useful objects through manufacturing. Heavy industrial activities are typically pushed away from residential and central commercial areas. Examples of heavy industrial manufacturing include automobile plants and the steel industry.

Light Manufacturing

Light manufacturing activities are typically where assembly and distribution processes occur and usually involve items produced for the consumer. These may include apparel, home accessories, food, clothing, furnishings, computers, and electronic devices.

Loft/Warehouse Buildings

Lofts and warehouses provide space where inventory is stored prior to being shipped out. Loft buildings in high-rent areas are frequently converted into residential loft-style living space, which is far more lucrative for developers than using a high-rent area for storing widgets.
